

Logs are important, specially for production server. For development or QA servers, they might not be as important since you can turn on errors directly on the screen.

Here's how to easily disable log (access and error log) in apache to avoid excessive writes on local server.

Open your `/etc/apache2/apache2.conf` file and change the following two configurations:

Change the `ErrorLog` to:

```
ErrorLog /dev/null
```

Now, open `/etc/apache2/conf.d/other-vhosts-access-log` and comment the following line

```
#CustomLog /var/log/apache2/other_vhosts_access.log vhost_combined
```

In addition, you might have to change these files:

- `/etc/apache2/sites-available/default-ssl`
- `/etc/apache2/sites-available/default`

and change the `ErrorLog` and comment out the `CustomLog`:

```
ErrorLog /dev/null  
#CustomLog ${APACHE_LOG_DIR}/access.log combined
```
